

## EFFECTIVE POSTER PRESENTATIONS

In planning a poster presentation it is useful to keep in mind the advantages of a poster over oral presentation. Posters are available for viewing for approximately two hours, not 10 minutes. Authors & interested viewers have an extensive period for discussion, not 5 minutes. More posters can be presented in the same time & space than oral presentations, & the number of simultaneous sessions can be reduced by 40% or more.

Finally, there is no first or last presentation on the program. Planning & experience will make your poster presentation **clear, effective & rewarding**.

## GUIDELINES

Posters should be readable by viewers 5 feet away. The message should be clear & understandable without oral explanation.

1. Initial sketch Plan your poster early. Focus your attention on a few key points, i.e., a poster is NOT a manuscript. Try various styles of data presentation to achieve clarity & simplicity. Does the use of color help? What needs to be explained in words? Suggest headlines & text topics.
2. Layout Enlarge your best initial sketch, keeping the dimensions in proportion to the final poster. Poster mounts typically consist of gray fabric material & are ~60" wide & 50" high. Ideally, the rough layout should be full size. A blackboard is a convenient place to work. Print the title & headlines. Indicate text by horizontal lines. Draw rough graphs & tables. This will give you a good idea of proportions & balance. If you are working with an artist, show the artist the poster layout. Ask associates for comment. This is still in the experimental stage.
3. Final layout The artwork is now complete. The text & tables are typed but not necessarily enlarged to full size. Now ask, **is the message clear? Do important points stand out? Is the pathway through the poster clear?**

Your poster materials may be attached to the poster mounts by push pins. Many participants attach their printed materials, graphs or photographs to pieces of colored poster board beforehand & then attach these pieces to the mount. Carefully consider the color of your poster board. Your poster must also include a large heading which gives the title of your poster, your name, names of all collaborators & appropriate institutional affiliations.

Depending on your budget, you can also consider having your poster produced by a commercial poster production company. They will provide proofs before finalizing & will send you your poster as a single rolled document ready for display.

## GUIDELINES continued

4. **Balance** Figures & tables should slightly cover more than 50% of the poster area. If you have only a few illustrations, make them large. Do not omit text, but keep it brief. The poster should be understandable without oral explanation since some visitors to your poster will not have time to discuss it with you.

5. **Typography** Avoid abbreviations, acronyms & jargon. Use a consistent type style throughout. Use large type. An 8<sup>1</sup>/<sub>2</sub> x 11 sheet of paper photostatically enlarged 50% makes text readable from 5 feet.

6. **Eye movement** The movement (pathway) of the eye over the poster should be natural, enter at upper left then down the columns or along rows. Size attracts attention. Arrows, numbers & letters can help clarify the sequence.

7. **Simplicity** The temptation to overload the poster should be resisted, i.e., **it is not meant to be a manuscript**. More material actually may mean less effective communication.

8. **Anticipate how you will interact with visitors to your poster** Although a poster must stand alone to communicate the key points of your work, a poster also offers great opportunities for discussion with visitors to your poster. Think in advance of how you plan to talk about your poster.

## **Examples of posters: good & bad**

**The following poster by Thomas et al demonstrates a balance of information & graphics. It is intended to be an example of a well-done poster.**

**It is designed in a way that makes it easy for the reader/visitor to come up to the poster, read & discuss the presentation with the authors as needed. It was prepared in final form by a professional poster production company.**

## Purpose:

❖ Autologous peripheral blood lymphocytes (PBL), activated in a mixed cell reaction when co-cultured with purified rabbit lacrimal epithelial cells, are known to induce a Sjögren's-like autoimmune dacryoadenitis when injected directly back into the donor animal's remaining inferior lacrimal gland (LG) or subcutaneously at a remote site.

❖ The purpose of the present study was to determine the ability of intravenously (IV) injected autologous stimulated lymphocytes to home to the LG and induce dacryoadenitis.

## Methods:

❖ One inferior LG was surgically excised from each rabbit. Acinar epithelial cells were purified, cultured for 2 days, gamma-irradiated, and then co-cultured for 5 days with purified autologous PBL. Activated lymphocytes were used for autoadoptive transfer.

❖ Rabbits receiving activated lymphocytes are referred to as the induced dacryoadenitis (ID) group.

❖ Normal control rabbits and those receiving non-stimulated lymphocytes are referred to as control and NS injected control, respectively.

❖ Ocular surface exams were done every 2 weeks after injection.

❖ All animals were sacrificed at the end of 4 or 8 weeks.

❖ Fig. 1. Histopathology with H&E stain at 4 weeks. **A.** Normal iLG showed occasional small lymphocytic aggregates. **B.** NS control was very similar to Normal. **C.** In the ID group lymphocytic infiltration was substantial in periductal and perivenular areas. **D.** Acinar cells with pale pink color (shown by arrow) may represent a beginning stage of degeneration.

**E&F:ID tissue at 8 weeks: E.** Post IV injection there are normal acinar cells (ac) as well as atypical acinar cells (aac) with fibrotic connective tissue (fct). **F.** A large area of atypical acinar cells is shown within circled area.

**G&H: ID tissue at 8 weeks: G.** These LG frequently have streaming lymphocytes (ly) around ducts. Ductal areas (d) are atypically surrounded by dense fibrotic connective tissue (fct). **H.** Large aggregates of lymphocytes are more frequent (see arrow)

**I: ID tissue at 8 weeks:** Enlarged area shows plump pink acinar cells (see inside square). Acini are often dramatically altered or atypical. **J.** This lobule has shrunken atypical acinar cells (aac) which closely resemble ducts. Accumulation of fat is evident in such lobes (see arrow).

**Fig. 2. Clinical ocular surface status after induction of disease.** (A) Schirmer test, (B) tear break-up time, (C) rose bengal tests were performed at 2 weeks interval up to 8 weeks. Normal and injected NS control were not significantly different.

| Parameter Evaluated                  | Direct Injection  | Subcutaneous Injection | Intravenous Injection |
|--------------------------------------|-------------------|------------------------|-----------------------|
| Onset of detectable clinical dry eye | 2w post injection | 4w post injection      | 4w post injection     |
| Severity of Disease                  |                   |                        |                       |
| 1) Schirmer Test                     | <50%              | <25%                   | <50%                  |
| 2) Tear BUT                          | <80%              | <40%                   | <70%                  |
| 3) Rose Bengal Score                 | > 4               | > 3.5                  | > 2                   |
| Increase of Lymphocytes in LG        | Fold Increase     | Fold Increase          | Fold Increase         |
| 1)IRTLA:                             | >7.4              | >1.7                   | >3                    |
| 2)CD18*                              | >21               | >3.2                   | >11                   |
| 3)CD4*                               | >7.3              | >3.5                   | >13                   |

## Results:

❖ Tear production in ID animals was reduced 50% by 4 weeks and tear break up time was 70% less than normal. Ocular surface defects assessed by rose bengal staining were not as pronounced as after direct injection.

❖ However, 4 weeks after IV injection, unique areas of streaming lymphocytes were observed and lymphocytes were found close to interlobular and intralobar ducts.

❖ At 8 weeks LG showed clusters of abnormal lacrimal acinar cells and streaming lymphocytes. The fibrotic connective tissue and increased lipid deposition is evident in areas with acinar degeneration (or ductal proliferation).

❖ Immunohistochemical staining revealed that inflammatory infiltrates were composed of predominantly CD4+ T cells.

## Conclusion:

❖ Regardless of the injection site lymphocytes activated against lacrimal antigens can home to the lacrimal gland and are capable of inducing autoimmune dacryoadenitis, suggesting that the LG constitutively contains not only antigen presenting cells displaying potentially pathogenic autoantigen epitopes, but also chemokines and homing molecules that recruit CD4+ T cells.

❖ We propose that these mediators normally recruit regulatory cells, but also recruit pathogenic effector cells that have been activated in peripheral lymphoid tissues.

EY012689, EY005801, EY010550, EY003040 and grants from RPB and Allergan.

The design is weak in this presentation & there is little or no hint of how to approach & read the poster. It is provided simply as an example of poor design & for this short guide the legibility of text was not a factor, i.e., just an example.

**Too crowded, confusing colors & organization. Remember that text must be large enough to be read a few feet away from the poster.**

Many jagged edges catch the eye

Many abbreviations referring the viewer back & forth across the poster

Figures grouped awkwardly

Multiple colors placed apparently randomly

**Poor design, too complex, too many items displayed. A poster should present the most important data, but not attempt to be a manuscript in itself.**

The natural start point for most individuals is from upper left, i.e., it is automatic. Your poster should be designed with that in mind. This example does not succeed. Title & authors (with institutional affiliations) should be at top, intro or background at upper left, flow of information proceeds from upper left – down – etc to conclude at lower right.

# Bioengineering an Artificial Lacrimal Gland: Transepithelial Bioelectrical Properties of Rabbit Acinar Cell Monolayers on Polyester Membrane Scaffolds

Program# 1883

## Introduction:

Insufficient production of tear fluid by the lacrimal glands leads to a chronic, potentially disabling condition known as dry eye.<sup>1</sup> Treatment strategies for this condition are aimed at rehydrating the ocular surface with electrolyte-balanced lubricant eye drops and ointments, that provide some relief but usually don't arrest or reverse eye damage. As a long-term therapeutic strategy for this condition, we envision a tissue-engineered tear secretory system that could be surgically implanted in the periocular tissues that would produce sufficient tear flow to maintain the health of the ocular surface.<sup>2</sup>

## Purpose:

We previously showed that rabbit lacrimal acinar cells cultured on various polymeric substrata in the presence of an extracellular matrix protein, Matrigel<sup>®</sup>, retained histiotypic morphology & cell function typical of lacrimal acinar cells *in vivo*.<sup>3</sup> The current study demonstrates active transepithelial ion fluxes across rabbit lacrimal acinar cell monolayers (RLACMs) on polyester membrane scaffolds in an attempt to evaluate the bioelectrical properties of the cultured cells.

## Methods:

Purified RLACs were seeded onto polyester membrane inserts. Confluent cell monolayers were stained with anti-occludin antibody. Tissue was prepared for Transmission electron microscopy (TEM) to evaluate the morphological properties of the cells. To evaluate bioelectrical properties, cell monolayers with transepithelial resistances (TER) in the range of 500-1500 ohms.cm<sup>2</sup> were studied (Ussing chambers) under short-circuit conditions. Cells were stimulated with basal-lateral (BL) addition of carbachol (CCh, 100 μM). Active ion fluxes were evaluated by inhibiting the short circuit current ( $I_{sc}$ ) with a

Na,K-ATPase inhibitor, ouabain (100 μM, BL) & under Cl-free buffer conditions following CCh stimulation. Regulated protein secretion was also evaluated by measuring the β-hexosaminidase catalytic activity in the apical (AP) culture medium in response to 100 μM CCh.

## TEM image

Fig. 1. Transmission electron micrographs of RLACs cultured on polyester membrane inserts. (A) The cells exhibited features typical of a glandular epithelium with apical microvilli (top arrowheads), secretory granules (g), and clear vesicles (v). The cells were joined by junctional complexes (boxed area) that included tight junctions near the apical surface. Double arrows at the bottom represent the polyester substratum. (B) A further magnification of the boxed area with a series of desmosomes.

## Immunofluorescence staining for occludin

Fig. 2. Confocal microscopic evaluation of occludin, a tight junction-associated protein, in pLGACs cultured on a 12-well polyester membrane insert using rhodamine red-X-conjugated donkey anti-goat IgG secondary antibody. Nuclei of cells are visualized with DAPI (blue). Note that the nuclear stain and the occludin in a given cell could rarely both be captured in the same plane of focus due to apical level of the junctional complex.

## Na,K-ATPase inhibition with

Fig. 3. Actual time course of carbachol-stimulated apical-to-basal  $I_{sc}$  and its inhibition by ouabain in RLACM on a polyester membrane insert in an Ussing chamber. Addition of 100 μM ouabain to the basal-lateral compartment rapidly altered the bioelectric properties of the cells. The instantaneous decrease in  $I_{sc}$  was accompanied by a rapid increase in TER after treatment with ouabain. Data represented is an actual trace from one of four separate experiments (n=4).

## Cl-free buffer exchange

Fig. 4. Actual time course of inhibition of the carbachol-stimulated  $I_{sc}$  with apical and basal-lateral Cl-free buffer exchange following carbachol stimulation (100 μM, BL) in RLACM on a polyester membrane insert in an Ussing chamber. The Cl-free buffer exchange rapidly altered the bioelectric properties of the cells. The instantaneous decrease in  $I_{sc}$  was accompanied by a rapid increase in TER during buffer exchange. Data represented is an actual trace from one of four separate experiments (n=4).

## β-hexoaminidase assay

Fig. 5. β-hexosaminidase protein released on the basal and apical side of the culture medium from lacrimal acinar cells cultured on 12-well inserts when exposed with or without carbachol (CCh, 100 μM, BL, 30 min). The results represent average ± SE expressed in arbitrary units (A.U.) of four separate determinations (n=4). (\*) represents significant increase at  $P \leq 0.05$  from resting values and apical stimulated secretion of the cultured cells.

## Results:

TEM of sections revealed cell monolayers with well-maintained epithelial cell polarity, i.e., presence of AP secretory granules, microvilli & junctional complexes. The presence of tight cell junctions was demonstrated by a positive circumferential stain for occludin. Cell monolayers spontaneously generated a small baseline  $I_{sc}$  in the BL→AP direction. However, stimulation with CCh induced a large  $I_{sc}$  (20-60 μA/cm<sup>2</sup>) in the AP→BL direction. Inhibition of BL Na,K-ATPase with ouabain completely abolished  $I_{sc}$ . Furthermore, replacing both the AP and BL fluids with Cl-free buffer solution returned  $I_{sc}$  back to baseline values. CCh stimulation increased AP protein secretion 11-fold ( $P < 0.05$ ) over the resting values of the cultured cells.

## Conclusion:

The generation of a Cl-dependent, ouabain-sensitive AP→BL  $I_{sc}$  in response to CCh demonstrates that RLACs are capable of establishing continuous epithelial monolayers that generate active ionic fluxes consistent with current models for Na<sup>+</sup>-dependent Cl<sup>-</sup> secretion.<sup>4</sup> We believe the results indicate great promise for the fabrication of a fluid-secreting lacrimal gland device.

### Mercury Bioaccumulation and Trophic Transfer in the Terrestrial Food Web of a Montane Forest

Person Centered ECOSTUDIES  
Kurt P. McFarland<sup>1</sup>, Christopher C. Remmer<sup>1</sup>, Eric K. Miller<sup>1</sup>, Robert J. Taylor<sup>1</sup>, and Steven D. Faccio<sup>1</sup>

<sup>1</sup> School of Life Sciences, P.O. Box 480, Boulder, Colorado 80502, USA; <sup>2</sup> U.S. Geological Survey, 2215 North Cascade Blvd., Boulder, Colorado 80502, USA; <sup>3</sup> Department of Biology, University of Colorado, Boulder, Colorado 80502, USA

**Abstract**  
Mercury bioaccumulation in montane forest food webs is a concern because of its potential to affect human health. We investigated mercury concentrations in a montane forest food web in Colorado, USA. We measured mercury concentrations in various trophic levels including plants, insects, and vertebrates. Mercury concentrations were highest in vertebrates, particularly in birds of prey. Mercury concentrations in plants were low, but increased significantly in insects and vertebrates. Mercury concentrations in vertebrates were highest in birds of prey, particularly in golden eagles. Mercury concentrations in insects were highest in predators, particularly in spiders. Mercury concentrations in plants were highest in vascular plants, particularly in shrubs. Mercury concentrations in soil were highest in organic matter, particularly in leaf litter. Mercury concentrations in water were highest in streams, particularly in headwater streams. Mercury concentrations in air were highest in the atmosphere, particularly in the boundary layer. Mercury concentrations in the food web were highest in vertebrates, particularly in birds of prey. Mercury concentrations in insects were highest in predators, particularly in spiders. Mercury concentrations in plants were highest in vascular plants, particularly in shrubs. Mercury concentrations in soil were highest in organic matter, particularly in leaf litter. Mercury concentrations in water were highest in streams, particularly in headwater streams. Mercury concentrations in air were highest in the atmosphere, particularly in the boundary layer.

### Strategies for Integrating Family Planning into HIV Treatment and Care: Preliminary Findings from Ghana

Authors: Edward Bwire, Kung'we, Oluwole, Polina, Priscilla, Richard, Robert, Quality Health Partners Fund

**Background**  
The HIV and AIDS pandemic affects women disproportionately, particularly women of reproductive age. In Ghana in 2007 the overall national prevalence of HIV was 2.2%, but in the 25-49 age group the prevalence was 3.5% (2007 HIV Sentinel Surveillance Report). Sixty percent (60%) of these infections are in women (2008 NACP Annual Report).

**Challenges**  
Clinical care for PLHIV patients and access to anti-retroviral therapy has been scaled up rapidly in Ghana. In 2005 there were only four ART sites in the country and at the end of 2007 there were 95 ART and 422 PMCT sites.

**Challenges**  
In this context, where clinical care for patients is rapidly improving, there is an increased interest in sexual activity among PLHIV and also in planning a family. The universal recognition that all men and women, regardless of the HIV status, have the right to make free and informed choices regarding their sexual health and reproduction has apparently not received as much attention as treatment.

**Challenges**  
In 2006, the Quality Health Partners Project, in cooperation with the National AIDS Control Programme (NACP) and the ACQUIRE project conducted a performance needs assessment at two pilot sites before FP-ART integration implementation. Some of the key findings from this assessment included:  
1. All FP clinic providers routinely talk about HIV, however providers at HIV clinical care do not routinely discuss FP.  
2. There is an absence of formal referral systems between HIV and FP clinics.  
3. Client record forms do not prompt the provider to discuss sexual activity, family planning or disclosure to partners beyond the first assessment visit.  
4. The concepts of "dual protection" and "dual method use" were not properly understood (95% of HIV clinical staff could not correctly state what the terms meant).  
5. 42% of women clients attending the HIV clinic would have had the nurse or doctor to have talked with them about FP during their consultation.

### Initial FP-ART Integration Strategy (2006-2008)

The initial strategy focused on two pilot facilities (Korlebu Teaching Hospital and Abasi Government Hospital). Training materials, health education materials and job aids were developed to train HIV clinical care providers in FP methods so they could provide FP services during the clinic visit. This intervention included:  
1. Routine health talks at the HIV clinic on FP for PLHIV clients.  
2. HIV clinic providing contraceptives, oral contraceptives and condoms on site.  
3. Referral systems for PLHIV who want long acting or permanent methods.  
4. Registers to compile data on FP uptake among clients.

**PLHIV Use of FP Methods During Integration Pilot at Two Hospitals**

| Dec 08 | 10              | 10   | 10   | 10   | 10            | 10   | 10   | 10   |

**Challenges**  
Uptake among PLHIV in the pilot facilities was very slow due to a number of factors:  
1. HIV clinic staff already felt overwhelmed and adding FP counseling and service provision added to their already heavy workload.  
2. Transfers of trained staff out of the clinic, reduced the effectiveness of the intervention.  
3. There were problems with accessing and accounting for FP commodities outside the FP clinic.  
4. To compound problems, there was also a nationwide strike by health workers to demand better pay in the middle of the pilot that affected service provision for more than one month.

**Using the lessons learned from the pilot, FP-ART integration was incorporated into GHP's main HIV intervention called HPH (High Impact Package), which was designed to address gaps in the quality of service provision at 25 ART sites throughout Ghana. The HPH initiative focuses on improving clinical care, ensuring stigma of HIV+ patients in facilities and ensuring access of patients to the continuum of care.**

**At the same time, in coordination with the ACQUIRE project, QHP worked with non-country partners to incorporate awareness of FP services for HIV+ clients into PLHIV community activities. This was accomplished by training 75 peer educators at HIV clinical care do not routinely discuss FP.**

### Expanded Strategy on FP-ART Integration (2007-2008)

As part of the HPH initiative and following from the results of the pilot, a new strategy to integrate FP into ART services was developed. The key tenets of this new approach were:  
1. Ensure FP providers in facilities received contraceptive technology updates on FP and ART.  
2. Ensure that FP providers participate in stigma reduction training so they did not turn PLHIV away due to fear.  
3. Strengthen health education on FP during HIV clinic visits by asking the FP provider to come and talk to patients and ensure that referral mechanisms are in place to get clients interested in FP at the clinic.  
4. Place reminder "stickers" in client folders to prompt the provider to discuss FP with clients and refer them to the FP clinic when appropriate.  
5. Include discussions of FP in the general discussions of clinical care during COPED exercises at the facility.  
6. Work with community groups to increase discussion of FP at the community level and refer clients to facilities for care.

**Results and the Way Forward**  
Early results show that clinicians have been effective in reminding providers to explore FP needs with clients and that training for providers has increased the numbers of clients seeking FP services. However, unexplained pregnancies in the PLHIV population are still occurring.

**Challenges**  
The growing interest among ART clients to have children indicates a need for new initiatives to provide information to clients on planning safe pregnancies coupled with access to non-stigmatizing FP services. The availability of routine FP services alone will not ensure PLHIV to participate.

**Challenges**  
QHP plans to work with providers throughout 2008 and 2009 to discuss how pregnancy counseling can be introduced into clinical care services, coupled with improving the quality of FP counseling for those who would like to use it. There is no definitive successful strategy for FP-ART integration in Ghana at present, but adaptability to changing circumstances will be best address the needs of the clients.

# Cross-species Comparison of Known and Predicted GDF-9 and GDF-9B Protein Sequences

## Abstract

Genetic differentiation between G and HB (GDF9 and GDF9B) have a distinct geographic stability indicated by the transmembrane domain (TMD) region, and a significant divergence between the conserved and variable regions. Regions for these proteins have been previously identified for 4 transmembrane domains.

We investigated which protein structure (GDF9) suggested divergence and expressed sequences (GDF9B) in later expression for the mouse region of GDF9 and GDF9B in a larger number of transmembrane domain (TMD) region. The model identified the transmembrane domain of the protein.

The resulting sequence alignment revealed a high level of similarity between the two sequences and provided an overall analysis. Homology modeling was performed for the two protein domains using the PDB template structure. The results show that the two proteins have a similar structure and a high degree of conservation in the TMD region.

## Functional Prediction For Conserved Sequence Region: Using Homology Modeling As A Tool

Homology modeling of GDF9 and GDF9B was performed using the Crystallographic Structure of the protein. The model shows that the two proteins have a similar structure and a high degree of conservation in the TMD region. The results show that the two proteins have a similar structure and a high degree of conservation in the TMD region.

## GoCaRe: A Novel Bioinformatics Tool For Identifying Groups of Proteins With Shared Regions of Conservation

GoCaRe is a novel bioinformatics tool for identifying groups of proteins with shared regions of conservation. It is designed to identify conserved regions across multiple protein sequences, allowing for the identification of functional domains and motifs. The tool uses a combination of sequence alignment and statistical analysis to identify conserved regions.

## Identification Of Essential Protein Features Through Cross-Species Analysis

This method identifies essential protein features through cross-species analysis. It involves comparing protein sequences across different species to identify conserved regions and features. The results show that certain protein features are essential for function and are conserved across species.

## Conclusion

The results of this study indicate that GDF9 and GDF9B have a similar structure and a high degree of conservation in the TMD region. The identification of essential protein features through cross-species analysis provides valuable insights into the function and evolution of these proteins.

# MULTINUCLEON TRANSFER REACTIONS $^{90}\text{Zr} + ^{208}\text{Pb}$

Deža Jelavić, Ruđer Bošković Institute, Zagreb, Croatia

## AIM

$^{90}\text{Zr} + ^{208}\text{Pb}$  reactions at  $E_{\text{c.m.}} = 50$  MeV have been studied using high efficiency and high resolution PRISMA-CLARA detector setup.

The PRISMA spectrometer has been placed at two different angles, in the vicinity of grazing angle, covering the most of the transfer flux. Differential and total cross sections and total kinetic energy loss distributions have been measured, and compared with coupled channel calculations based on semiclassical theories. Such comparison provides important information about the relevant degrees of freedom which act in transfer processes in quasi-stable regime. In particular, it has been shown that multinucleon transfer reactions are an ideal tool to study nucleus-nucleus correlations, and we searched for the enhanced inclusive cross sections in the (-2p) and (-2n) channels. Via a pairing-vibration model scheme we were looking for the population strength and the decay of pairing-vibrational states.

## PRISMA - CLARA SETUP

PRISMA is a large acceptance magnetic spectrometer designed for the A=100-200, E=5-10 MeV heavy ions operating at the Laboratory Nacional de Lagos. It consist of a magnetic quadrupole singlet, placed at 70cm from the target, and a magnetic dipole 19° bending angle and 1.2m curvature radius. It's main characteristic are the large solid angle of  $\sim 6$  steradians (corresponding to  $\pm 4^\circ$  in  $\theta$  and  $\pm 11^\circ$  in  $\phi$ ), a maximum acceptance  $\Delta p/p \sim 1\%$  and a dispersion of  $\sim 4$  km per percent in momentum.

## STEP 1

## STEP 2

## STEP 3

## STEP 4

## STEP 5

## RESULTS

The calculated cross sections have been obtained by using the semiclassical model GRAZING. This model calculates the evolution of the reaction by taking into account, besides the relative motion, the intrinsic degrees of freedom of projectile and target (nuclear surface modes and the single nucleon transfer channels). The multinucleon transfer channels are described via a multi-step mechanism. The relative motion of the system is calculated in a nuclear plus Coulomb field. The evolution of the intrinsic degrees of freedom is obtained by employing the wall-bounce force factors for the collective surface vibrations and the one particle transfer channels. The model takes into account the effect of neutron evaporation.

The analysis is in progress! We are now merging together data of the two different PRISMA angles in order to obtain complete angular distributions and to increase statistics in gamma spectra of interest.
